

Remark Office OMR 12.1

New Features

October 2025

★ Indicates customer request

Features and Enhancements:

Remark Quick Stats

- ★ **Student Test Report Limits:** Due to intensive memory usage, the Student Test Report was updated to allow 100 images each time it runs. Select the number of students for which to run the report to stay within this number.
- Student Test Report with Boolean Regions:** The Student Test Report now includes support for regions set to the Boolean type.
- ★ **Partial Credit Update:** You can now set up an "and" situation with partial credit when more than one response is correct (meaning all answers have to be selected to receive credit). The import file requires that the correct answers be delimited by "+", "&", or "and".

General

Anchor Mark Utility: Remark Office OMR now includes an Anchor Mark Utility that allows you to upload a PDF of your form and add anchor marks to the corners. Anchor marks help Remark properly recognize data on forms, particularly those that are tightly packed or have lines or other elements near the bubbles.

Fixes:

Remark Quick Stats

- ★ **Test Analysis Report:** An issue was fixed where you would hide the Questions to Review section in the report's properties but it would still display on the report.
- ★ **Respondent Column Header Missing in Export:** When exporting data from Remark Quick Stats using the custom format, the respondent ID column header was missing, causing data to appear shifted.
- Student Test Report with Multiple Answer Keys:** We fixed an issue where the correct answers displayed on the Student Test report were those of the original answer key when using advanced multiple answer keys (note that the grading was correct).

Data Center/General

- ★ **Image Basename Issue:** We fixed an issue where the Read window was not holding the settings for the image basename in the Name Builder.
- ★ **Resizing the Data Center:** We fixed an issue where sometimes the Data Center wouldn't resize correctly when you double click the header.
- ★ **Extra Characters when Exporting:** We fixed an issue where extra characters appeared if you included "Page 1" as part of your data set.
- ★ **Auto Form ID Error:** We fixed a "Process cannot access the file" error when reading forms using Auto Form ID.

- ★ **Auto Form ID Error# -2146233088:** We fixed error-2146233088 when reading images of different sizes in auto form ID mode.
- ★ **Slow Image Processing:** We improved processing speed when reading images that require Remark to rotate the page to find the marks.
- ★ **Missing Bubbles:** When the recognition option to detect missing or damaged bubbles was off, Remark was still not flagging the region as an error.
- ★ **Color Image Clips:** Image clips captured in color were not displaying in color.

Template Editor

- Database Lookup:** We fixed an issue when you set up two regions over top of one another using Database Lookup and the regions that are replacing data from the database were pulling from the wrong database field.
- ★ **Using Enter in Labels:** Pressing Enter when entering the last label in the region properties no longer triggers a "missing label" message.
- ★ **Linked OMR Regions:** A problem was fixed where you could only enter the number of multiple responses that equated to the first region in a linked region.
 - Database Lookup as Respondent ID:** An issue was fixed when using a database lookup region as the respondent ID where it was holding the setting for any additional returned fields to also be a respondent ID.
- ★ **Database Lookup Error 9000 with MariaDB:** We fixed an error "9000" that occurred when connecting to MariaDB for database lookup.
- ★ **Negative Point Values:** When using negative point values in the Analysis section of a template, with a comma as the decimal, the point values were not being held.
 - Multiple Responses Allowed:** We fixed an issue when allowing multiple responses in the template where you could not include the maximum number of options.
